

I support the ARRL proposal as submitted. The current radiotelephone allocations seem quite crowded when propagation is favorable while the non-radiotelephone portions of the same amateur bands do not appear to be so - based on my own observations in the 80-, 40- and 15-meter bands. It would be advantageous to the Amateur Radio Service to encourage experimentation in new transmission modes as part of the proposed reallocation, but this can be handled in an informal, non-regulatory manner among the Service licensees, without Commission action.
